A Predictive Vehicle Ride Sharing Recommendation System for Smart Cities Commuting

Dr. Theodoros Anagnostopoulos

WORLD
CHANGING
GLASGOW

Vehicle Riding Sharing System

- Smart Cities
- Smart Mobility
- Vehicle Ride Sharing
- Future Location Prediction Service
- Personalized Recommendation Service

Smart Cities

- Cities 2.0
- Industry 4.0
- Internet of Things
- Artificial Intelligence
- Robotics

Smart Mobility

- Unmanned Aerial Vehicles
- Autonomous Vehicles
- Connected and Autonomous Vehicles
- Intelligent Transport Systems
- Smart Parking

Vehicle Ride Sharing

- Vehicle Pooling
- Ride Sharing
- Ride Hailing
- Commute System
- Uber
- Taxi Beat

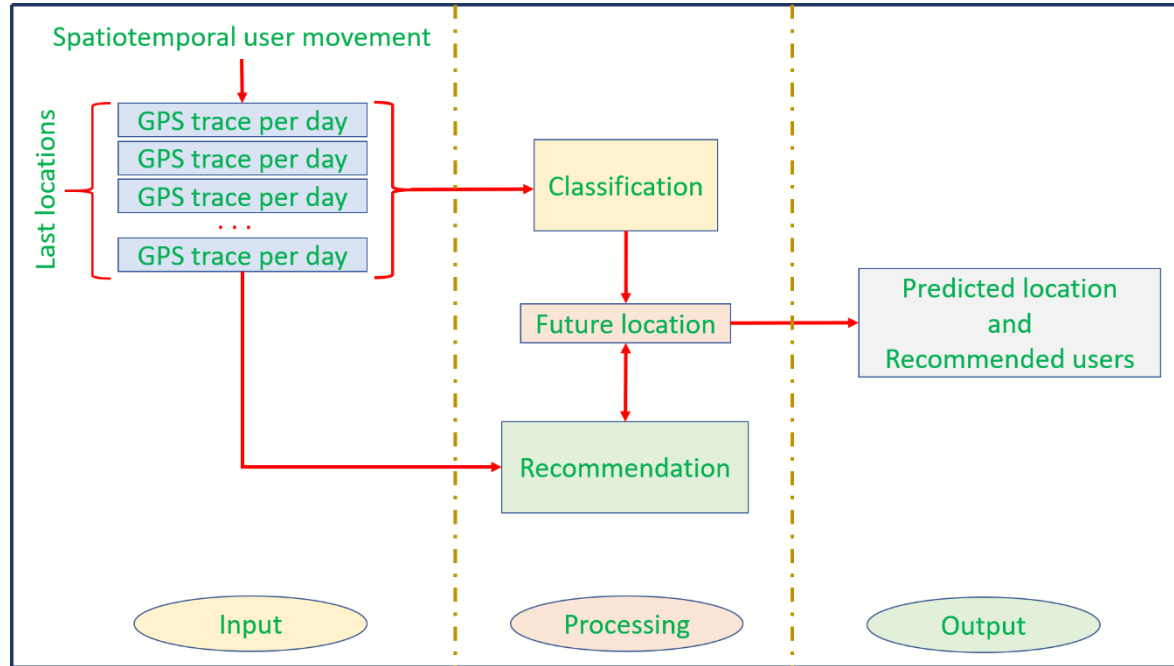

Future Location Prediction Service

- Where am I?
- What time is it?
- Where the system infers I will go to in the near and/or far future?
- Does the system support detours?
- Am I satisfied from the system's location prediction service?

Personalized Recommendation Service

- Do I want to go alone?
- Do I need company?
- How many persons will accompany me?
- Does the companion have the same spatiotemporal mobility behavior with me?

Prediction & Recommendation Model

#	Prediction and Recommendation Algorithm
1	Input: KB // knowledge base, i // examined instance, d //day of the week, m //historic window size, l // prediction window size,
2	μ //spatial historic similarity threshold, ϑ //spatial prediction similarity threshold, k //recommendation list size
3	Output: N //returned recommendation list
4	Begin
5	$N \leftarrow \text{Null}$ //returned recommendation list is empty, $k \leftarrow \text{read}()$ //initialize recommendation list size
6	$i \leftarrow \text{read}()$ //read the examined instance from user mobile app, $j \leftarrow \text{read}(KB)$ //read the first instance of the KB
7	While ($j \neq KB(\text{EoF})$) Do //traverse KB
8	If ($(d(i) = d(j)) \text{ AND } (i(m) - j(m) \leq \vartheta) \text{ AND } (i(l) - j(l) \leq \vartheta)$) Then //if current and predicted locations of i, j are similar w.r.t. ϑ similarity for certain day
9	For ($n \in [0, m - 1]$) Do //traverse from first to last historic location of the trajectory
10	If ($i(n) - j(n) \leq \mu$) Then //step by step historic comparison
11	$\varphi \leftarrow \varphi + 1$ //historic similarity flag increases
12	End If
13	End For
14	If ($\varphi = n$) Then //if historic similarity condition w.r.t. μ holds proceed to recommendation list step
15	If ($\text{size}(N) \leq k$) Then //if size of N is less than or equal to k
16	$N \leftarrow N + j$ //recommendation list is expanded
17	Else
18	$\text{sort}(N)$ //sort recommendations in ascending order of similarity
19	$\text{return}(N)$ //return recommendation list and exit
20	End If
21	End If
22	End If
23	End While
24	End

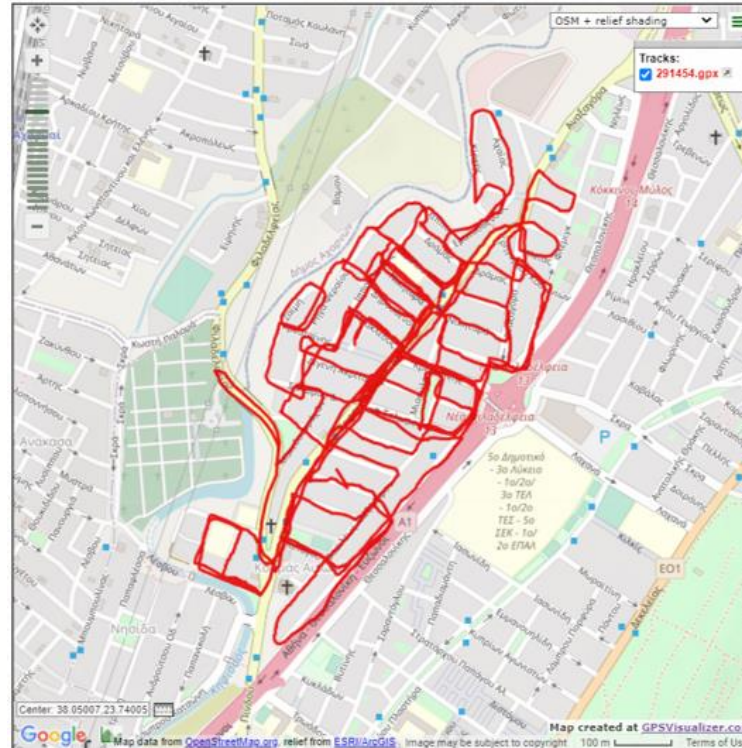

Evaluation Method & Metrics

- 10-Fold Cross Validation Evaluation Method
- Prediction Accuracy Evaluation Metric
- Recommendation MAP@N Evaluation Metric

Experiments – Data Visualization

Experiments – Data Structure

Dataset Experimental Parameters

School of Computing Science
Essence: Pervasive &
Distributed Computing

Parameter	Value
GPS traces length	8 decimal digits
Sensitivity	10 meters
Minimum latitude	38.04582595
Minimum longitude	23.73619793
Maximum latitude	38.05432318
Maximum longitude	23.74390125
Coverage area	0.64 square kilometers

University
of Glasgow

Model Experimental Parameters

School of Computing Science
Essence: Pervasive &
Distributed Computing

Parameter	Value
l	1 GPS predicted location
ϑ	0.00000001 (10 meters)
μ	0.000001 (100 meters)
$ U $	100 users totally
$ KB $	2958 instances

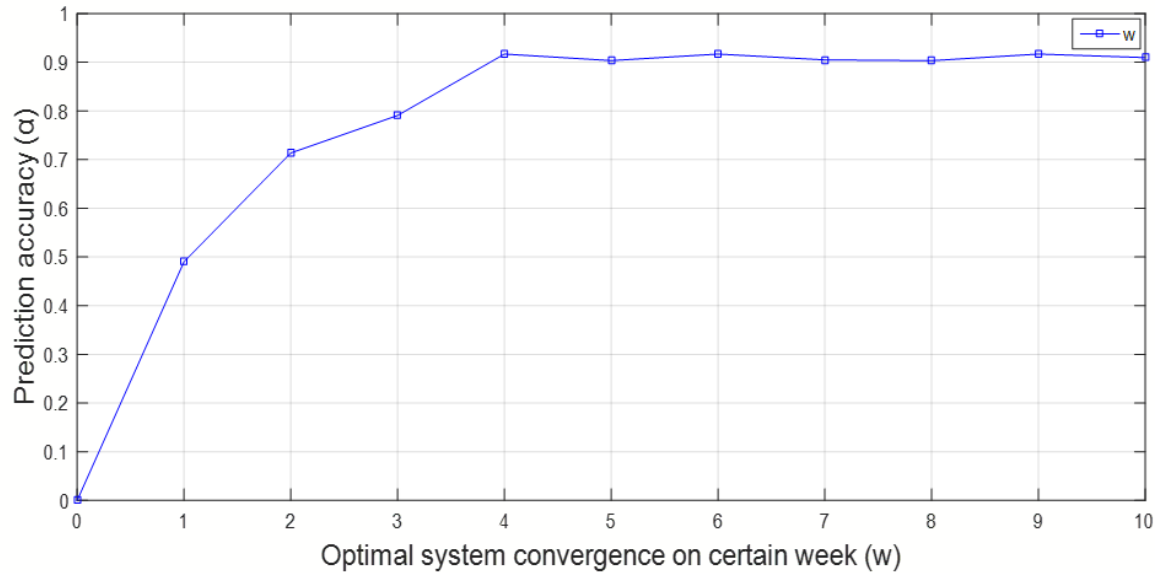

Results – Historic Window Size

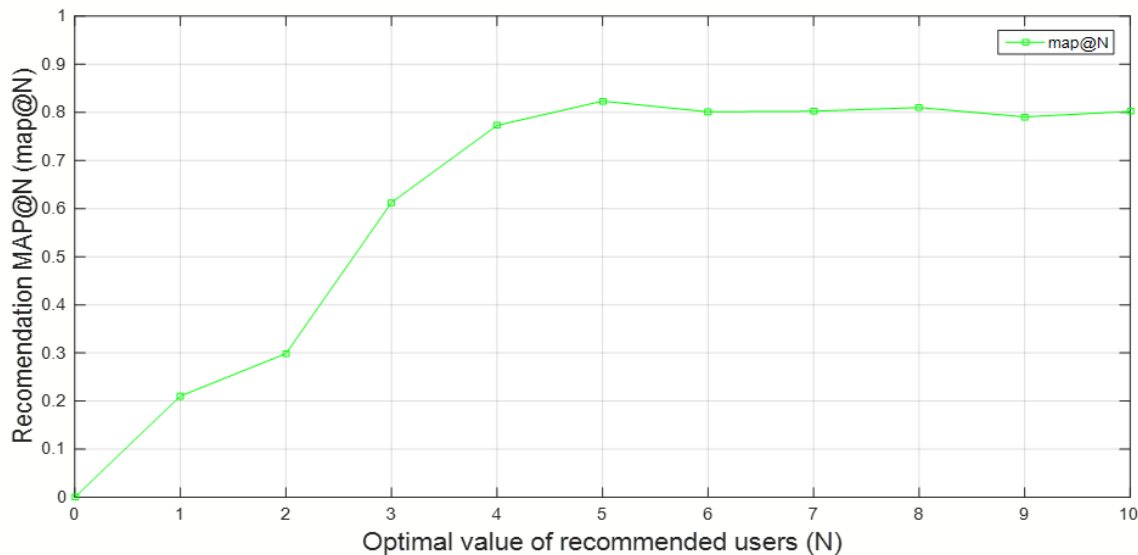

Results – Optimal System Convergence

Results – Recommended Users

Future Directions

- Time of Arrival Estimation to Destination Service
- Citizen – Centric Qualitative Data Sources
- Social Networks Mobility Context
